SignalTrap
Receiver control Software

The SignalTrap Software allows users to interface with and combine the capabilities of a Rohde & Schwartz FSH-3 spectrum analyzer, RRT's THiEF (Tactical Handheld Emitter Finder), and up to three (3) AOR receivers (AR8600 or AR8200) bringing them together to function as one collection and analysis platform. The software displays and replicates all of the storage and search capabilities of the AOR devices in a user friendly spreadsheet format. All collected Signal Related Information (SRI) including audio is saved on the connected laptop and can be easily parsed during post mission analysis using standard SQL queries.

Radio Reconnaissance Technologies, Inc.
